### **Advanced Machine Learning**

### Online Convex Optimization - Part 2 -

#### Learning goals

- Know the connection between OGD and FTRL via linearization of convex functions
- See how this implies regret bounds for OGD
- Get to know the theoretical limits for online convex optimization

#### **ONLINE GRADIENT DESCENT**

ullet The Online Gradient Descent (OGD) algorithm with step size  $\eta>0$  chooses its action by

$$a_{t+1}^{\text{OGD}} = a_t^{\text{OGD}} - \eta \nabla_{\mathbf{a}} (a_t^{\text{OGD}}, z_t), \quad t = 1, \dots T.$$
 (1)

(Technical side note: For this update formula we assume that  $\mathcal{A}=\mathbb{R}^d$ . Moreover, the first action  $a_1^{\mathrm{OGD}}$  is arbitrary. )

#### **ONLINE GRADIENT DESCENT**

 $\bullet~$  The  $\it Online~Gradient~Descent~(OGD)$  algorithm with step size  $\eta>0$  chooses its action by

$$a_{t+1}^{\text{OGD}} = a_t^{\text{OGD}} - \eta \nabla_a (a_t^{\text{OGD}}, z_t), \quad t = 1, \dots T.$$
 (1)

(Technical side note: For this update formula we assume that  $\mathcal{A}=\mathbb{R}^d$ . Moreover, the first action  $a_1^{\mathrm{OGD}}$  is arbitrary. )

- We have the following connection between FTRL and OGD:
  - Let  $\tilde{z}_t^{\mathrm{OGD}} := \nabla_a(a_t^{\mathrm{OGD}}, z_t)$  for any  $t = 1, \ldots, T$ .
  - ullet The update formula for FTRL with  $_2$  norm regularization for the linear loss  $L^{
    m lin}$  and the environmental data  $ilde{z}_t^{
    m OGD}$  is

$$a_{t+1}^{ ext{FTRL}} = a_{t}^{ ext{FTRL}} - \eta \tilde{z}_{t}^{ ext{OGD}} = a_{t}^{ ext{FTRL}} - \eta \nabla_{a}(a_{t}^{ ext{OGD}}, z_{t}).$$

• If we have that  $a_1^{\mathrm{FTRL}} = a_1^{\mathrm{OGD}}$ , then it iteratively follows that  $a_{t+1}^{\mathrm{FTRL}} = a_{t+1}^{\mathrm{OGD}}$  for any  $t = 1, \ldots, T$  in this case.

# ONLINE GRADIENT DESCENT: DEFINITION AND PROPERTIES

With the deliberations above we can infer that

$$\begin{split} R_{T,}^{\mathrm{OGD}}(\tilde{\boldsymbol{a}} \mid (\boldsymbol{z}_t)_t) &= \sum\nolimits_{t=1}^{T} (\boldsymbol{a}_t^{\mathrm{OGD}}, \boldsymbol{z}_t) - (\tilde{\boldsymbol{a}}, \boldsymbol{z}_t) \\ &\leq \sum\nolimits_{t=1}^{T} L^{\mathrm{lin}}(\boldsymbol{a}_t^{\mathrm{OGD}}, \tilde{\boldsymbol{z}}_t^{\mathrm{OGD}}) - L^{\mathrm{lin}}(\tilde{\boldsymbol{a}}, \tilde{\boldsymbol{z}}_t^{\mathrm{OGD}}) \\ & \text{ (if } \boldsymbol{a}_1^{\mathrm{OGD}} = \boldsymbol{a}_1^{\mathrm{FTRL}}) \sum\nolimits_{t=1}^{T} L^{\mathrm{lin}}(\boldsymbol{a}_t^{\mathrm{FTRL}}, \tilde{\boldsymbol{z}}_t^{\mathrm{OGD}}) - L^{\mathrm{lin}}(\tilde{\boldsymbol{a}}, \tilde{\boldsymbol{z}}_t^{\mathrm{OGD}}) \\ &= R_{T,L^{\mathrm{lin}}}^{\mathrm{FTRL}}(\tilde{\boldsymbol{a}} \mid (\tilde{\boldsymbol{z}}_t^{\mathrm{OGD}})_t), \end{split}$$

where we write in the subscripts of the regret the corresponding loss function and also include the corresponding environmental data as a second argument in order to emphasize the connections.

# ONLINE GRADIENT DESCENT: DEFINITION AND PROPERTIES

With the deliberations above we can infer that

$$\begin{split} R_{T,}^{\mathrm{OGD}}(\tilde{\boldsymbol{a}} \mid (\boldsymbol{z}_{t})_{t}) &= \sum\nolimits_{t=1}^{T} (\boldsymbol{a}_{t}^{\mathrm{OGD}}, \boldsymbol{z}_{t}) - (\tilde{\boldsymbol{a}}, \boldsymbol{z}_{t}) \\ &\leq \sum\nolimits_{t=1}^{T} L^{\mathrm{lin}}(\boldsymbol{a}_{t}^{\mathrm{OGD}}, \tilde{\boldsymbol{z}}_{t}^{\mathrm{OGD}}) - L^{\mathrm{lin}}(\tilde{\boldsymbol{a}}, \tilde{\boldsymbol{z}}_{t}^{\mathrm{OGD}}) \\ & \text{ (if } \boldsymbol{a}_{1}^{\mathrm{OGD}} = \boldsymbol{a}_{1}^{\mathrm{FTRL}}) \sum\nolimits_{t=1}^{T} L^{\mathrm{lin}}(\boldsymbol{a}_{t}^{\mathrm{FTRL}}, \tilde{\boldsymbol{z}}_{t}^{\mathrm{OGD}}) - L^{\mathrm{lin}}(\tilde{\boldsymbol{a}}, \tilde{\boldsymbol{z}}_{t}^{\mathrm{OGD}}) \\ &= R_{T,L^{\mathrm{lin}}}^{\mathrm{FTRL}}(\tilde{\boldsymbol{a}} \mid (\tilde{\boldsymbol{z}}_{t}^{\mathrm{OGD}})_{t}), \end{split}$$

where we write in the subscripts of the regret the corresponding loss function and also include the corresponding environmental data as a second argument in order to emphasize the connections.

• Interpretation: The regret of the FTRL algorithm (with  $_2$  norm regularization) for the online linear optimization problem (characterized by the linear loss  $L^{\mathrm{lin}}$ ) with environmental data  $\tilde{z}_t^{\mathrm{OGD}}$  is an upper bound for the OGD algorithm for the online convex problem (characterized by a differentiable convex loss ) with the original environmental data  $z_t$ .

- Due to this connection we immediately obtain a similar decomposition of the regret upper bound into a bias term and a variance term as for the FTRL algorithm for OLO problems.
- Corollary. Using the OGD algorithm on any online convex optimization problem (with differentiable loss function ) leads to a regret of OGD with respect to any action  $\tilde{a} \in \mathcal{A}$  of

$$\begin{aligned} R_T^{\text{OGD}}(\tilde{\mathbf{a}}) &\leq \frac{1}{2\eta} \left| \left| \tilde{\mathbf{a}} \right| \right|_2^2 + \eta \sum_{t=1}^T \left| \left| \tilde{\mathbf{z}}_t^{\text{OGD}} \right| \right|_2^2 \\ &= \frac{1}{2\eta} \left| \left| \tilde{\mathbf{a}} \right| \right|_2^2 + \eta \sum_{t=1}^T \left| \left| \nabla_{\mathbf{a}} (\mathbf{a}_t^{\text{OGD}}, \mathbf{z}_t) \right| \right|_2^2. \end{aligned}$$

- Due to this connection we immediately obtain a similar decomposition of the regret upper bound into a bias term and a variance term as for the FTRL algorithm for OLO problems.
- Corollary. Using the OGD algorithm on any online convex optimization problem (with differentiable loss function ) leads to a regret of OGD with respect to any action  $\tilde{a} \in \mathcal{A}$  of

$$\begin{aligned} R_T^{\text{OGD}}(\tilde{\mathbf{a}}) &\leq \frac{1}{2\eta} \left| \left| \tilde{\mathbf{a}} \right| \right|_2^2 + \eta \sum_{t=1}^T \left| \left| \tilde{\mathbf{z}}_t^{\text{OGD}} \right| \right|_2^2 \\ &= \frac{1}{2\eta} \left| \left| \tilde{\mathbf{a}} \right| \right|_2^2 + \eta \sum_{t=1}^T \left| \left| \nabla_{\mathbf{a}} (\mathbf{a}_t^{\text{OGD}}, \mathbf{z}_t) \right| \right|_2^2. \end{aligned}$$

ullet Note that the step size  $\eta>0$  of OGD has the same role as the regularization magnitude of FTRL: It should balance the trade-off between the bias- and the variance-term.

• As a consequence, we can also derive a similar order of the regret for the OGD algorithm on OCO problems as for the FTRL on OLO problems by imposing a slightly different assumption on the (new) "variance" term  $\sum_{t=1}^{T} ||\nabla_a(a_t^{\rm OGD}, z_t)||_2^2.$ 

• As a consequence, we can also derive a similar order of the regret for the OGD algorithm on OCO problems as for the FTRL on OLO problems by imposing a slightly different assumption on the (new) "variance" term  $\sum_{t=1}^{T} \left| \left| \nabla_{a}(a_{t}^{\mathrm{OGD}}, z_{t}) \right| \right|_{2}^{2}.$ 

- $\sup_{\tilde{a} \in A} ||\tilde{a}||_2 \le B$  for some finite constant B > 0
- $\sup_{a \in \mathcal{A}, z \in \mathcal{Z}} ||\nabla_a(a, z)||_2 \le V$  for some finite constant V > 0.

Then, by choosing the step size  $\eta$  for OGD as  $\eta = \frac{\mathit{B}}{\mathit{V}\sqrt{2\,\mathit{T}}}$  we get

$$R_T^{\rm OGD} \leq BV\sqrt{2\,T}.$$

- **Theorem.** For any online learning algorithm there exists an online convex optimization problem characterized by
  - a convex loss function ,

- Theorem. For any online learning algorithm there exists an online convex optimization problem characterized by
  - a convex loss function ,
  - a bounded (convex) action space  $A = [-B, B]^d$  for some finite constant B > 0,

- Theorem. For any online learning algorithm there exists an online convex optimization problem characterized by
  - a convex loss function ,
  - a bounded (convex) action space  $A = [-B, B]^d$  for some finite constant B > 0,
  - and bounded gradients  $\sup_{a \in \mathcal{A}, z \in \mathcal{Z}} ||\nabla_a(a, z)||_2 \leq V$  for some finite constant V > 0,

- **Theorem.** For any online learning algorithm there exists an online convex optimization problem characterized by
  - a convex loss function ,
  - a bounded (convex) action space  $A = [-B, B]^d$  for some finite constant B > 0,
  - and bounded gradients  $\sup_{a \in \mathcal{A}, z \in \mathcal{Z}} ||\nabla_a(a, z)||_2 \leq V$  for some finite constant V > 0,

such that the algorithm incurs a regret of  $\Omega(\sqrt{T})$  in the worst case.

- Theorem. For any online learning algorithm there exists an online convex optimization problem characterized by
  - a convex loss function ,
  - a bounded (convex) action space  $A = [-B, B]^d$  for some finite constant B > 0,
  - and bounded gradients  $\sup_{a \in \mathcal{A}, z \in \mathcal{Z}} ||\nabla_a(a, z)||_2 \leq V$  for some finite constant V > 0,

such that the algorithm incurs a regret of  $\Omega(\sqrt{T})$  in the worst case.

• Recall that under (almost) the same assumptions as the theorem above, we have  $R_T^{\rm QGD} \leq BV\sqrt{2T}$ .

- Theorem. For any online learning algorithm there exists an online convex optimization problem characterized by
  - a convex loss function ,
  - a bounded (convex) action space  $A = [-B, B]^d$  for some finite constant B > 0,
  - and bounded gradients  $\sup_{a \in \mathcal{A}, z \in \mathcal{Z}} ||\nabla_a(a, z)||_2 \leq V$  for some finite constant V > 0,

such that the algorithm incurs a regret of  $\Omega(\sqrt{T})$  in the worst case.

- Recall that under (almost) the same assumptions as the theorem above, we have  $R_T^{\rm OGD} \leq BV\sqrt{2T}$ .
- $\rightarrow$  This result shows that the Online Gradient Descent is *optimal* regarding its order of its regret with respect to the time horizon T.
